

OPTIMUM DRYING FOR ALL
AROMATIC PLANTS

OptiDry[®]

YOUR ADVANTAGES

- ▶ Energy and cost-saving conditioning
- ▶ Fast and even drying process
- ▶ Extraction of valuable essential aromatic and healing oils
- ▶ Best drying results
- ▶ Can be combined with all WOLF drying equipment (CONAQUA II, Lupus Pro)

The drying of aromatic plants such as hops, hemp and herbs requires a very high amount of energy. Valuable heat energy flows unused into the open air. WOLF closes the heat circuit and reintroduces lost energy from the exhaust air into the system. A plate heat exchanger with high efficiency heats the supply air with the exhaust air heat without mixing the two air streams.

VentiDeck[®]

The VentiDeck technology ensures a fast and even drying process. The heavy and moist drying exhaust air is quickly extracted from the kiln and cannot settle again

on the material to be dried. The energy-efficient EC fans are individually and continuously adjustable. This enables absolutely uniform drying over the entire surface.

Öl-Extractor

Essential oils are already extracted from the fresh crop during the drying process. The oil and moist-containing drying air condenses on the plate heat exchanger and the valuable condensate runs off in the stainless steel WOLF 3D-Condensate Tray. Highly concentrated essential oils collect on the surface of the liquid and can be reused.
